Cornell Notes	Topic: Introduction to Responsive Web sites	Course: BSc Computer Science
		Class: Web Development CM1040[Lecture]
		Date: December 10, 2020
Essential Question:		
What is responsive and accessible website design?		
Questions/Cues:		
<ul style="list-style-type: none">• What was an early solution to responsive web design?• What is the viewport?• What is the @media query and what properties of the display can be queried?		
Notes		
<ul style="list-style-type: none">• RWD = An early solution to the responsive web design was to design a mobile version and a desktop version. While this seemed like a good idea, it was frustrating for users because the mobile and desktop version often had different content and capabilities present. A solution to this problem was to provide CSS with the ability to interrogate a browser for information about the device, the display capabilities and the viewport<ul style="list-style-type: none">◦ Viewport = the display space that is available to the browser to present web content◦ The CSS facility that provides this capability is the @media query, which can be used to build CSS rules depending on the value returned to the query.<ul style="list-style-type: none">■ Properties of the display that can be queried include:<ul style="list-style-type: none">■ Display and viewport height and width■ Resolution■ Display orientation■ Color capabilities■ Whether the display supports a mouse pointer or not◦ Once a response to the query has been returned from the browser, CSS properties for the HTML elements in the page can be bundled into a set of rules to define the presentation for the given situation		
Summary		
In this week, we learned about what responsive web design means, the viewport and CSS @media queries.
